

Title: Emerging KRAS Inhibitors in Oncology

Abstract

KRAS is one of the most frequently mutated oncogenes in cancer.

Recent advances in KRAS inhibitor development have led to the approval of Sotorasib and Adagrasib for KRAS G12C mutated cancers.

Key Findings

1. Sotorasib targets KRAS G12C mutation.
2. Adagrasib demonstrates efficacy in NSCLC patients.
3. KRAS inhibition reduces MAPK pathway activation.
4. Therapeutic response observed in lung cancer patients.

Conclusion

KRAS inhibitors represent a major advancement in targeted oncology.
