

Title: Lung Cancer Research Study

Abstract

Non-small cell lung cancer (NSCLC) accounts for approximately 85 percent of lung cancer cases.

Important Biomarkers

1. KRAS
2. EGFR
3. ALK
4. BRAF

Clinical Findings

Patients harboring KRAS mutations demonstrated improved outcomes when treated with KRAS-targeted therapies.

Evidence

Sotorasib was associated with a significant improvement in progression-free survival among KRAS G12C patients.

Conclusion

Targeted treatment strategies improve outcomes in NSCLC.
